

Project Design Phase – Incident Lifecycle Automation in ServiceNow

Project Design Document

1. System Architecture

The system will be designed using ServiceNow's standard Incident Management framework. The design connects users, the incident table, automation rules, SLA management, notifications, and reporting.

Basic Flow:

User → Incident Creation → Categorization → Priority → Assignment → Investigation → Resolution → Closure

2. Incident Lifecycle Design

State	Description
New	Incident is created and waiting for processing
Assigned	Incident is assigned to a support group/technician
In Progress	Technician is investigating the issue
On Hold	Work is temporarily paused
Resolved	Solution has been provided
Closed	Incident is completely closed

3. Automation Design

- Business Rules – Automate server-side incident processing.
- Client Scripts – Validate and dynamically control form fields.
- UI Policies – Make fields mandatory, visible, or read-only based on conditions.
- Flow Designer – Automate assignment, notifications, and escalation workflows.
- Assignment Rules – Automatically determine the appropriate support group.
- SLA – Track response and resolution deadlines.
- Notifications – Inform users and support teams about important changes.

4. Priority Design

Priority will be calculated using Impact and Urgency.

Impact + Urgency → Priority

For example:

- High Impact + High Urgency → Critical Priority
- High Impact + Medium Urgency → High Priority
- Low Impact + Low Urgency → Low Priority

5. SLA & Escalation Design

The system will monitor each incident against its defined SLA.

SLA Started → SLA Monitoring → Warning → SLA Breach → Escalation

When an incident approaches its SLA deadline, the responsible team can receive a notification. If the SLA is breached, the incident can be automatically escalated.

6. Notification Design

Notifications will be triggered for events such as:

- Incident creation
- Assignment to a support group
- Assignment to a technician
- Incident update
- SLA warning
- SLA breach
- Incident resolution
- Incident closure

7. Reporting & Dashboard Design

The project will include dashboards/reports to monitor:

- Total incidents
- Open vs. closed incidents
- Incidents by priority
- Incidents by assignment group
- SLA breached incidents
- Average resolution time
- Incident trends

8. Expected Design Outcome

The final design will provide a structured and automated incident lifecycle, reducing manual intervention and ensuring that incidents are properly created, prioritized, assigned, tracked, escalated, resolved, and closed within the defined SLA.
