

Project Development Phase – Incident Lifecycle Automation in ServiceNow

Project Development Document

1. ServiceNow Configuration

- Configure the Incident Management module.
- Create and configure required incident fields.
- Configure incident forms, views, roles, and access permissions.

2. Incident Lifecycle Development

Implement the complete incident workflow:

New → Assigned → In Progress → On Hold → Resolved → Closed

Each state will have appropriate conditions and transitions.

3. Automation Development

Develop automation using ServiceNow features:

- **Business Rules** – Automate server-side incident operations.
- **Client Scripts** – Validate and dynamically control incident forms.
- **UI Policies** – Make fields mandatory, visible, or read-only when required.
- **Flow Designer** – Automate assignment, notifications, escalation, and lifecycle transitions.
- **Assignment Rules** – Automatically assign incidents to the correct support group.

4. Priority Automation

Implement automatic priority calculation based on Impact and Urgency.

Impact + Urgency → Priority

This ensures critical incidents receive higher priority and faster attention.

5. SLA Implementation

Configure SLA rules for incident response and resolution.

- Start SLA when the incident is created.
- Track remaining SLA time.
- Trigger warning notifications.

- Identify SLA breaches.
- Escalate breached incidents to the appropriate team.

6. Notification Development

Configure automated notifications for:

- New incident creation
- Assignment
- Incident updates
- SLA approaching
- SLA breach
- Resolution
- Closure

7. Resolution & Closure Automation

Before an incident is resolved, the system will verify that required resolution information is entered.

After resolution, the incident can proceed through the configured closure process.

8. Reports and Dashboard Development

Create reports and dashboards to monitor:

- Total incidents
- Open and closed incidents
- Incidents by priority
- Incidents by assignment group
- SLA breaches
- Average resolution time
- Incident trends

9. Development Outcome

The development phase will produce a working Incident Lifecycle Automation system in ServiceNow that minimizes manual activities and automates assignment, prioritization, SLA tracking, notifications, escalation, resolution, and closure.
